Solution

Part 3: Evaluating FashionMart’s data architecture: Strengths and areas for improvement

Assess FashionMart’s EDA by identifying its strengths and areas for improvement across key architectural components. Refer to *Part 3 in the lab instructions*.

1. Name of the enterprise: **FashionMart**

2. Strengths

Sr. No.	Strength	Description	Impact
1	Established Retail Data Infrastructure	FashionMart has well-established retail systems supporting physical store operations, sales tracking, and customer management.	Provides operational stability and reliable business processes across multiple store locations.
2	Centralized Data Warehouses	The organization maintains data warehouses that consolidate information from multiple business functions.	Enables business intelligence reporting and supports management decision-making.
3	Security and Governance Controls	The architecture includes RBAC, data encryption, compliance controls, and data quality processes.	Improves data protection, regulatory compliance, and overall data reliability.

3. Areas for improvement

Sr. No.	Area for improvement	Description	Impact
1	Data Silos	Customer, sales, inventory, and marketing data are distributed across multiple isolated systems.	Limits cross-functional analysis and prevents a unified business view.
2	Legacy Systems	Several systems rely on traditional retail technologies and batch-oriented processes.	Reduces flexibility, scalability, and real-time operational visibility.

3	Data Integration Capabilities	Existing integration relies mainly on ETL and periodic synchronization processes.	Creates delays in data availability and limits omnichannel retail capabilities.
